

The Law Society

The Brief

Working with the Law Society for over 20 years we have been fortunate to work on different projects involving a number of different integrators. Our latest project involved the upgrade of their Wireless network across 4 sites and new Fibre backbone across the main building.

The Proposal

Working closely with the client and their hardware provider we established the best locations to ensure perfect network coverage and infrastructure running throughout that would service their needs going forward.

The Technology

Due to the clients ever increasing need for wireless connectivity we needed to spec a robust system allowing for growth. We suggested an Exterior Grade OM4 Loose Tube Fibre due to some cables running over the roof, and a Cat 6a U/FTP Copper system for the access points.

The Installation

Due to the Grade II listed status of the building we had to ensure that the new backbone ran discreetly and access points were obscured wherever practicable.

The Challenges

Given the Grade II status of the building we had to be careful to ensure a neat, clean and tidy installation. Additionally, the building was in use during the normal working week so much of this installation had to be carried out at weekends or outside of normal office hours.

The Follow Up

Upon completion, full Test Results and Marked up drawings were supplied to the client.
